

Hi there,

Nice that you're applying with us. Just as you're probably curious about us, we're curious about you. What's important here is your knowledge and skill, both technical and procedural.

To get a sense of that, we'd like to present you with the following test. Based on your solution and a follow-up conversation, we hope to get a good understanding of your superpowers.

Setup

Here's how it works:

We'd like you to create a GitHub repository and share it with us as readers. This repository will be the main place where we review your work.

You'll have one day to complete the assignment. After that day, we'll review your repository and treat it as the final version. Following that, we'll discuss the results together.

Assignment

As you know, the nerd universe is divided into two factions:

Star Wars vs. Pokémon

First, choose which side you want to be on.

Both factions have an open-source API available, each offering a wealth of information about various characters.

The task:

- Create an **MCP server** in Python using a web framework of your choice that exposes one of these APIs.
- Create an **API for an AI agent** in Python, also using a web framework. The API should have a **conversation endpoint** as its entry point. The AI agent (either LLM-based or local) should use the MCP server to retrieve character data and respond conversationally.

Bonus:

Give the agent memory, allowing multiple conversation threads to exist simultaneously.
